

CSE 4/521

Introduction to Operating Systems

Lecture 2 – Introduction 2

(Storage Management, Protection and Security, Kernel
Data Structures, Computing Environments, Open-Source
Operating Systems)

Summer 2018

Overview

- What Operating Systems Do
- Computer-System Architecture
- Operating-System Structure
- Operating-System Operations
- Process Management
- Memory Management
- **Storage Management**
- **Protection and Security**
- **Kernel Data Structures**
- **Computing Environments**
- **Open-Source Operating Systems**

Previous Lecture

Recap

- What Operating Systems Do
 - **Definition** and **goals** of an Operating System.
- Computer-System Architecture
 - **Single processor** and **multi-processor** system.
- Operating-System Structure
 - **Multiprogramming** and **timesharing** system.
- Operating-System Operations
 - **Interrupt driven** and **dual-mode**.
- Process Management
 - What is a **process**? **Single-threaded** and **multi-threaded** process.
- Memory Management
 - Determines what instructions and data needs to **be in memory**.

Questions

1. What are the 3 **goals** of the operating system?
(Easy)
2. Under what circumstances would a user be better off using a **time-sharing** system than a **multi-programming** workstation. (Medium)
3. Some CPUs provide for more than two modes of operation. What are **two possible uses** of these **multiple modes**? (Hard)

Table of Content

- What Operating Systems Do
- Computer-System Architecture
- Operating-System Structure
- Operating-System Operations
- Process Management
- Memory Management
- Storage Management
- Protection and Security
- Kernel Data Structures
- Computing Environments
- Open-Source Operating Systems

Table of Content

- What Operating Systems Do
- Computer-System Architecture
- Operating-System Structure
- Operating-System Operations
- Process Management
- Memory Management
- **Storage Management**
- Protection and Security
- Kernel Data Structures
- Computing Environments
- Open-Source Operating Systems

Storage Management

- Migration of data 'A' from **Disk** to **Register**

- **Multitasking environments** must be careful to use **most recent value**, no matter where it is stored in the storage hierarchy
 - **Multiprocessor environment** must provide **cache coherency** in hardware such that all CPUs have the most recent value in their cache
-

Storage Management

| Level | 1 | 2 | 3 | 4 | 5 |
|---------------------------|--|-------------------------------|------------------|------------------|------------------|
| Name | registers | cache | main memory | solid state disk | magnetic disk |
| Typical size | < 1 KB | < 16MB | < 64GB | < 1 TB | < 10 TB |
| Implementation technology | custom memory with multiple ports CMOS | on-chip or off-chip CMOS SRAM | CMOS SRAM | flash memory | magnetic disk |
| Access time (ns) | 0.25 - 0.5 | 0.5 - 25 | 80 - 250 | 25,000 - 50,000 | 5,000,000 |
| Bandwidth (MB/sec) | 20,000 - 100,000 | 5,000 - 10,000 | 1,000 - 5,000 | 500 | 20 - 150 |
| Managed by | compiler | hardware | operating system | operating system | operating system |
| Backed by | cache | main memory | disk | disk | disk or tape |

Movement between levels of storage hierarchy can be explicit or implicit OS activities

- Free-space management
- Storage allocation
- Disk scheduling

Table of Content

- What Operating Systems Do
- Computer-System Architecture
- Operating-System Structure
- Operating-System Operations
- Process Management
- Memory Management
- Storage Management
- **Protection and Security**
- Kernel Data Structures
- Computing Environments
- Open-Source Operating Systems

Protection and Security

- **Protection** – any mechanism for **controlling access** of processes or users to resources defined by the OS
- **Security** – **defense of the system** against internal and external attacks
 - Denial-of-service, worms, viruses, identity theft, theft of service
- Systems generally first distinguish among users, to determine who can do what
 - User identities (**user IDs**, security IDs) include name and associated number, one per user
 - Group identifier (**group ID**) allows set of users to be defined and controls managed, then also associated with each process, file
 - **Privilege escalation** allows user to change to effective ID with more rights

Table of Content

- What Operating Systems Do
- Computer-System Architecture
- Operating-System Structure
- Operating-System Operations
- Process Management
- Memory Management
- Storage Management
- Protection and Security
- **Kernel Data Structures**
- Computing Environments
- Open-Source Operating Systems

Kernel Data Structures

- Singly linked list

- Doubly linked list

- Circular linked list

Kernel Data Structures

- Binary search tree

left \leq right

- Search performance is $O(n)$
- Comparisons in **Balanced binary search tree** is $O(\lg n)$

Kernel Data Structures

- **Hash function** can create a **hash map**

- **Bitmap** – string of n binary digits representing the status of n items
- Linux data structures defined in
include files `<linux/list.h>`, `<linux/kfifo.h>`,
`<linux/rbtree.h>`

Table of Content

- What Operating Systems Do
- Computer-System Architecture
- Operating-System Structure
- Operating-System Operations
- Process Management
- Memory Management
- Storage Management
- Protection and Security
- Kernel Data Structures
- **Computing Environments**
- Open-Source Operating Systems

Computing Environments

1. Traditional
2. Mobile
3. Distributed
 - Client-Server
 - Peer-to-Peer
4. Virtualization
5. Cloud Computing

Computing Environments - Traditional

- Stand-alone **general purpose** machines
- But blurred as most systems interconnect with others (i.e., the **Internet**)
- **Portals** provide web access to internal systems
- Networking becoming ubiquitous – even home systems use **firewalls** to protect home computers from Internet attacks

Computing Environments - Mobile

- Handheld **smartphones, tablets**, etc
- Extra feature – more OS features (GPS, gyroscope)
- Allows new types of apps like **augmented reality**
- Use IEEE 802.11 wireless, or cellular data networks for connectivity
- Leaders are **Apple iOS** and **Google Android**

Computing Environments - Distributed

- Collection of separate, possibly **heterogeneous**, systems **networked together**
 - **Network** is a communications path, **TCP/IP** most common
 - Local Area Network (LAN)
 - Wide Area Network (WAN)
 - Metropolitan Area Network (MAN)
 - Personal Area Network (PAN)
 - **Network Operating System** provides features between systems across network
 - Communication scheme allows systems to exchange messages
 - **Illusion of a single system**

Computing Environments – Distributed Client-Server

- Dumb terminals supplanted by smart PCs
- Many systems now **servers**, responding to requests generated by **clients**
 - **Compute-server system** provides an interface to client to request services (i.e., database)
 - **File-server system** provides interface for clients to store and retrieve files

Computing Environments – Distributed Peer-to-Peer

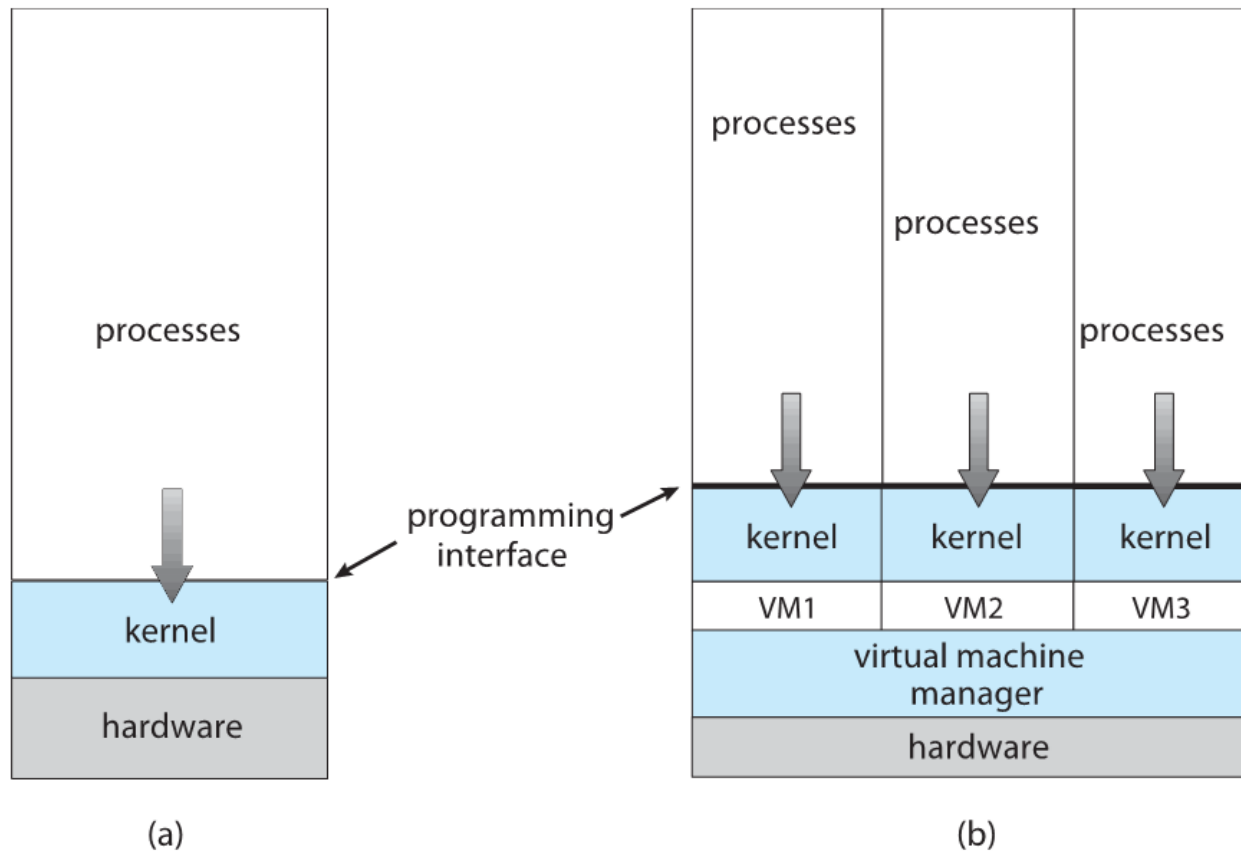

- Another model of distributed system
- P2P **does not distinguish clients and servers**
 - Instead all nodes are considered peers
 - May **each** act as **client, server or both**
 - Node must join P2P network
 - **Registers its service** with central lookup service on network, or
 - **Broadcast** request for service and **respond** to requests for service via discovery protocol
 - Examples include Napster and Gnutella, **Voice over IP (VoIP)** such as Skype

Computing Environments - Virtualization

- Use cases involve **laptops and desktops running multiple OSES** for exploration or compatibility
 - Apple laptop running Mac OS X host, Windows as a guest
 - Developing **apps for multiple OSES** without having multiple systems
 - Executing and **managing compute environments** within data centers
- VMM can **run natively**, in which case they are also the host
 - e.g.: VMware ESX, Citrix XenServer, VirtualBox

Computing Environment - Virtualization

Computing Environments – Cloud Computing

- Delivers **computing, storage, even apps as a service** across a network
- **Logical extension of virtualization** because it uses virtualization as the base for its functionality. (e.g., Amazon **EC2**)
- Many types
 - **Public cloud** – available via Internet to anyone willing to pay
 - **Private cloud** – run by a company for the company's own use
 - **Hybrid cloud** – includes both public and private cloud components
 - Software as a Service (**SaaS**) – use applications over Internet (e.g., word processor)
 - Platform as a Service (**PaaS**) – software stack over Internet (i.e., a database server)
 - Infrastructure as a Service (**IaaS**) – servers or storage over Internet (i.e., storage available for backup use)

Computing Environments – Cloud Computing

- Cloud computing environments **composed of traditional OSeS**, plus **VMMs**, plus **cloud management tools**
 - Internet connectivity requires security like firewalls
 - **Load balancers** spread traffic across multiple applications

Table of Content

- What Operating Systems Do
- Computer-System Architecture
- Operating-System Structure
- Operating-System Operations
- Process Management
- Memory Management
- Storage Management
- Protection and Security
- Kernel Data Structures
- Computing Environments
- Open-Source Operating Systems

Open-Source Operating Systems

- Operating systems made available in source-code format rather than just binary **closed-source**
- But Free Software Foundation (FSF), provides free OS for exploration using **GNU Public License (GPL)**
- Examples include **GNU/Linux** and **BSD UNIX** (including core of Mac OS X), and many more
- Use **Virtualbox** (<http://www.virtualbox.com>) to run guest operating systems for exploration

Credential for slides

Silberschatz, Galvin and Gagne
